

Wool/Wool Blend Upholstery Textiles

Care and Cleaning Instructions

S: Clean with only a water-free dry cleaning solvent

REGULAR MAINTENANCE

It is important to vacuum upholstery regularly to remove loose dirt and surface dust that builds up, before it becomes embedded in the fibers. Use a soft brush to loosen and brush away surface dirt, followed by vacuuming with an upholstery attachment. A dry cleaning solvent may be used on areas that are soiled with hair and body oils, following the steps below for spot cleaning. **Fabrics with a Cleaning Code "S" should not be cleaned with water, club soda, or water-based upholstery shampoos or cleaning agents, as these may cause shrinkage or create permanent water stains.** General soiling can be removed with a solvent-compatible spray extraction appliance. Periodically, a professional cleaner should thoroughly clean the upholstery to remove the soiling that a normal vacuum cleaner cannot reach.

SPOT CLEANING TREATMENT

Step 1: As soon as possible, blot liquid spills with an absorbent towel or a clean, colorfast cloth. Avoid using a scrubbing motion, as it may embed the staining material deeper into the fabric. Dry, solid material should be scraped with a blunt instrument and vacuumed.

Step 2: Apply a dry cleaning solvent sparingly to the soiled area, rubbing gently with a clean white cloth. The term "dry cleaning solvent" refers to non-water, hydrocarbon-based compounds. Pre-test a small, inconspicuous area to ensure there is no adverse reaction to the dyes or texture of the fabric. Blot the stain, turning the damp cloth frequently to avoid redepositing the stain.

Step 3: Repeat this process until the spot is removed or there is no further transfer to the cloth. If there are any rough areas, brush over them with a soft brush or vacuum the area to restore the original texture.

Step 4: Allow fabric to dry thoroughly before being used again. A hair dryer on a low setting can be used.

STAIN REMOVAL

The key to removing waterbased or oil-based stains is prompt action. The longer the stain is allowed to remain on a fabric, the more difficult it will be to remove. Always pre-test in a small inconspicuous spot to ensure there is no adverse reaction between the dyes and the cleaning agent. For stubborn stains, call a professional cleaner for advice.

Step 1: Soak up excess staining material immediately with an absorbent towel or a clean, colorfast cloth. Try to remove as much moisture as possible before proceeding.

Step 2: A dry cleaning solvent can be toweled onto heavily soiled areas to remove hair and body oils. Blot the areas with a clean cloth after 5-10 minutes. A soft brush can be used to agitate soiled areas.

Step 3: If the solvent is to be heated, it must be done in a solvent-compatible machine and should not be heated to exceed flash point. Ventilation must be provided prior to and during dry cleaning.

Step 4: An extractor or absorbent cloth can then be used to extract the solvent and suspended soil.

Step 5: Drying must be expedited by using air movement and ventilation. The fabric should be as dry as possible before using.
